Behavior Driven Content Suggestion System (EmoTrack)

Presented by: Ishika Kamra

Introduction

Todaypeople spend large amounts of time on social media platforms such as YouTube, Instagram, and Facebook. However, the content recommended by these platforms is often based only on viewing history rather than the user's emotional state or behavior.

As a result, users may receive content that does not match their mood or mental well-being.

EmoTrack is a system designed to suggest content based on user behavior and emotional patterns.

Problem Statement

Current content recommendationsystems haveseveral limitations:

- They mainly rely on watch history and clicks
- They do not understand the user's emotional state
- They may suggest addictive or distracting content
- They do not help users maintain a balanced digital lifestyle

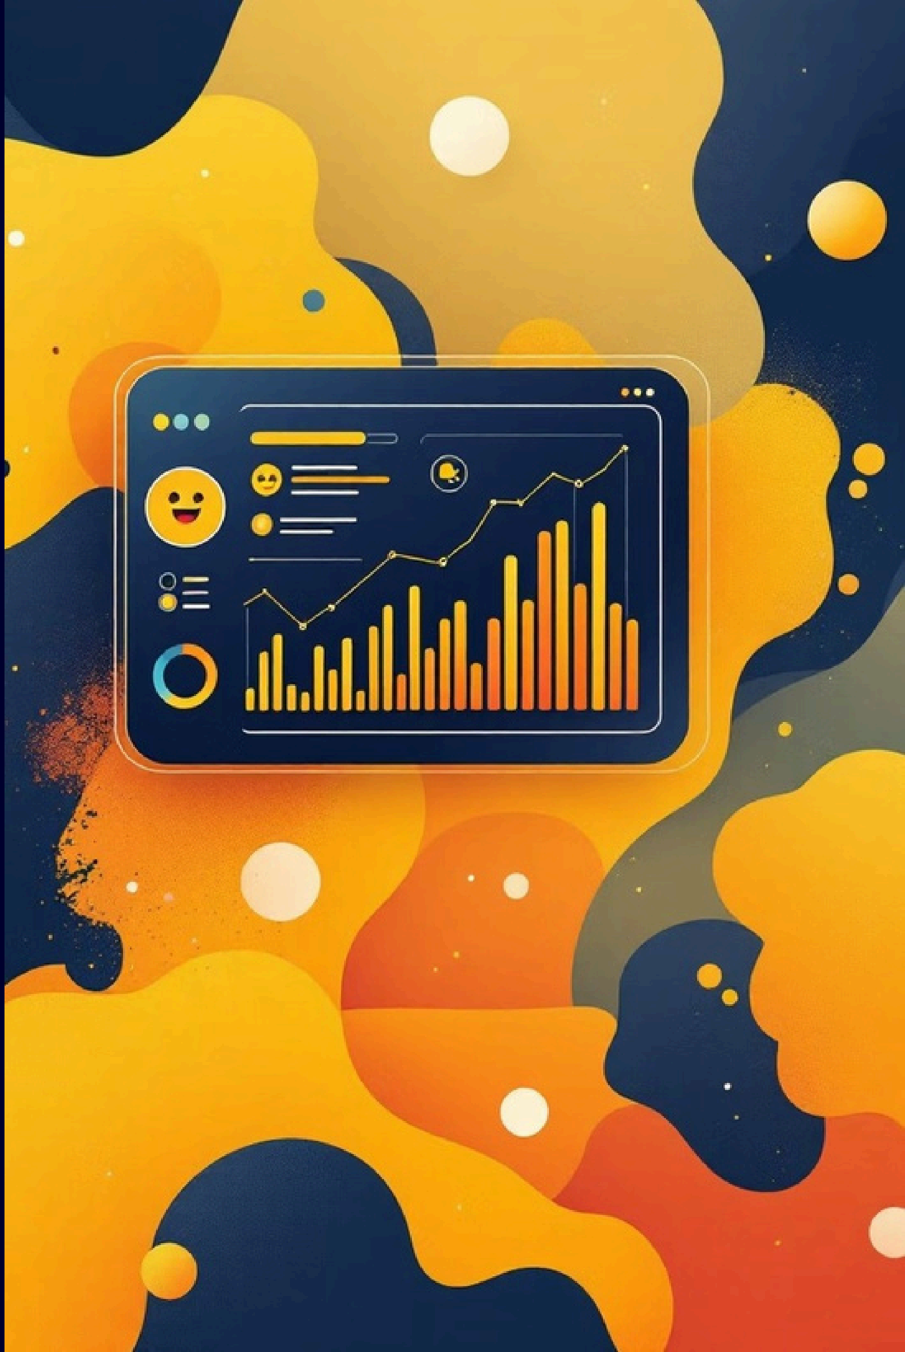
Therefore, there is a need for a system that suggests content based on user behavior and mood.

Proposed Solution

The**Behavior DrivenContentSuggestionSystem (EmoTrack)** analyzes user behaviorand emotional patternsto recommend suitable content.

The system tracks user interactions and analyzes mood patterns to provide content that supports productivity, learning, and positive engagement.

This helps users consume meaningful and relevant content.



System Objectives

The main objectives of EmoTrack are:

- To analyze user behavior and interaction patterns
- To detect emotional states using behavioral signals
- To suggest relevant and positive content
- To reduce excessive consumption of distracting media
- To promote balanced digital usage

System Architecture

01

User Interface (Frontend)

This layerallowsuserstointeractwith the system.

Functions:

- User Registration and Login
- Accessing the Dashboard
- Viewing recommended content

Technologies used:

- HTML
- CSS
- JavaScript

02

User Activity Tracking Module

Thismodulerecordsuserinteractions within the system.

Functions:

- Tracks user browsing history
- Stores previously viewed content
- Maintains interaction records for recommendation

The stored activity data helps understand user preferences.

03

Content Recommendation Module

Thismodule generates content suggestions based on the user's activity history.

Functions:

- Analyzes previously viewed content
- Identifies similar or related content
- Generates personalized suggestions

04

Backend Processing

Thebackend manages systemlogic and communication between the frontend and database.

Functions:

- Processes user requests
- Handles recommendation logic
- Retrieves and stores data

Technology used:

- Java

05

Database Layer

Thedatabasestoresallrequired system data.

Stored data includes:

- User information
- Login credentials
- Content history
- Suggested content records

Database used:

- Oracle Database

Technologies Used

Frontend

- HTML CSS
- JavaScript

Backend

- Java

Database

- Oracle Database

Other Tools

- Git &GitHub
- VS Code
- Docker

Key Features

User Login and Registration

Personalized Content Suggestions

Content Dashboard

User Interaction History

Workflow of the System

User logs into the system

User interacts with the platform

Suggestion engine generates content recommendations

Recommended content is displayed on the dashboard

Advantages

- Personalized recommendations
- Better mental well-being
- Reduced digital addiction
- Improved productivity
- Adaptive content suggestions
